1 Overview

The system generates floLIVE Data Warehouse (DWH) events for device activities such as Update Location, SMS-MO, etc.

The purpose of this document is to provide a detailed description of all supported DHW events.

2 API

JSON files represent FloLIVE Data Warehouse (DWH) events. Each JSON file uses human-readable text to transmit data regarding one event. The file includes pairs of attributes and values bounded in curly brackets. A comma separates each pair, and there is a colon within each pair between attribute and value. Values can be strings, integers, real numbers, and even a JSON file. As noted, the system will send each event in a different JSON file.

The system can parse JSON files that include only some of these attribute and value pairs. However, the system expects each JSON file to have a timestamp, action, and action id. So each JSON file **must** have at least the “ts”, “act” and “aid” attributes.

2.1 Attributes and Value Descriptions

The following are tables of attribute and value pairs that you can expect to find in the JSON file.

2.1.1 Action Type (Attribute: act)

Value	Action Title	Transmit/Receive	Comments
1	Send Authentication Info	Rx	
2	Update Location	Rx	
3	Purge MS	Rx/Tx	Delete roamer
4	Restore Data	Rx	Add a subscriber to VLR
